

# **The Economics of E-commerce and Technology**

Competitive Advantage

- 
- ▶ Industry analysis looks at what determined average profitability
  - ▶ What makes individual firms within an industry different?
  - ▶ To create an advantage, a firm must do something unique and valuable
  - ▶ Goal: Understand why some firms earn superior profits, and use this knowledge to evaluate strategic options.
  - ▶ Porter: “Competitive Strategy is about being different”

**Figure 1: Profitability Differences Across Selected Industries**

**Figure 2a: Profitability Differences Within the Pharmaceutical Industry**

**Figure 2b: Profitability Differences Within the Airline Industry**

# Two Questions

---

- ▶ **How does a firm create a competitive advantage?**
  - ▶ How can a firm position itself differently from its competitors?
  - ▶ What activities can a firm adopt that will differentiate itself?
  - ▶ About short-run profitability.
  
- ▶ **What makes a competitive advantage sustainable?**
  - ▶ What assets, resources or capabilities prevent imitation?
  - ▶ How can firm leverage existing assets, resources and capabilities?
  - ▶ About long-run profitability.

# Added Value

# The Value Pie

---

- ▶ **Total value of industry**
  - ▶ Utility of consumer minus opportunity costs of inputs
- ▶ **Added value of firm**
  - ▶ Reduction in total value of industry if your firm is annihilated.

# Value Creation: Example

---

- ▶ In 2009, Ruud Lighting signed deal with city of Los Angeles for 140,000 LED streetlights.
- ▶ Total value
  - ▶ LA saves \$100m by switching to LED
  - ▶ Price is \$57m
  - ▶ Ruud's costs are \$30m.
  - ▶ Total value = \$70m, LA gets \$43m, Ruud gets \$27m.
- ▶ Ruud's added value
  - ▶ What if Ruud is only LED company?
  - ▶ What if ACME can produce \$90m savings for cost \$25m?

# Added Value

---

- ▶ **Claim:** A firm's profits cannot exceed added value.
  - ▶ Idea: If firm's profits exceed added value, the other parties can jointly become better off by working around this firm.
- ▶ **Right questions are not**
  - ▶ Is this an attractive industry?
  - ▶ Is demand for product growing?
- ▶ **Right questions are:**
  - ▶ Can I make product at lower cost than competitor?
  - ▶ Can I create more value than my competitor?

# Added Value

---

- ▶ Ruud and ACME example
  - ▶ Ruud's profits are at most \$5m, so price is at most \$35m.
- ▶ Level of profits
  - ▶ Whether Ruud's profits are \$0 or \$5m depends on economics of industry.
  - ▶ What is Ruud's bargaining power? Who chooses prices?
  - ▶ If hold auction, profits = \$5m
  - ▶ If LA city names price then profits = \$0
- ▶ What is total/added value in perfectly competitive industry?

# Added value and industry economics

---

# Differentiation

# Product differentiation

---

- ▶ In the LED example, only one firm (the one with the greatest added value) can earn positive profits
- ▶ Often, consumers are heterogeneous (not just firms)
  - ▶ Some people prefer Android features, others iPhone features
  - ▶ Some people place low value on data plan and have old Nokia
- ▶ Many firms can have positive added value and earn profits
  - ▶ Understanding consumer heterogeneity is key to successful strategy

# Product Differentiation: Classification

---

- ▶ Consider two products: A and B
- ▶ Vertical differentiation
  - ▶ If  $p_A = p_B$  then everyone prefers A to B
  - ▶ If people value quality differently, some firms offer high-quality high-price goods; others offer low-quality low-price goods.
- ▶ Horizontal differentiation
  - ▶ If  $p_A = p_B$  then some prefer A and some prefer B.
  - ▶ Firms can carve out niches, targeting specific customers
- ▶ Measuring degree of heterogeneity
  - ▶ When we increase  $p_A$  how many people switch to B?

# Strategy: Horizontal Differentiation I

---

## ▶ Hotelling's Model

- ▶ Customers located uniformly distributed on line  $[0, 1]$ .
- ▶ Customers have transport costs  $cd$ , where  $d$  is distance.
- ▶ Firms have zero costs.

## ▶ Minimal differentiation: Both firms located at $1/2$

- ▶ Bertrand competition:  $p_A = p_B = 0$  and both get zero profit.

## ▶ Maximal differentiation: Firms located at 0 and 1

- ▶ Given prices  $(p_A, p_B)$  demand is given by

$$q_A = \frac{1}{2} + \frac{p_B - p_A}{2c} \quad \text{and} \quad q_B = \frac{1}{2} + \frac{p_A - p_B}{2c}$$

- ▶ Tradeoff: If lower price steal marginal customer, but make less money on inframarginal customers.
- ▶ Profit maximizing prices:  $p_A = p_B = c$  and profits  $\pi_A = \pi_B = c/2$ .

# Strategy: Horizontal Differentiation II

---

- ▶ Minimal or maximal differentiation?
- ▶ As A moves away from 0
  - ▶ Direct effect: It steals some of B's customers
  - ▶ Indirect effect: Price competition becomes more intense.
  - ▶ Suggests firm might move in a little, but not all the way.
- ▶ Other reasons to cluster
  - ▶ Be where demand is (e.g. Amazon market place).
  - ▶ Attract customers (e.g. malls).
  - ▶ If no price competition (e.g. radio stations, where use adverts).

# Strategy: Vertical Differentiation I

---

## ▶ Model

- ▶ Customers have valuations  $v \sim U[0, 1]$ .
- ▶ Two firms with qualities  $x_A$  and  $x_B$ , where  $x_A \geq x_B$ .
- ▶ Agents receives utility  $vx - p$ , where  $p = \text{price}$ .
- ▶ **Minimal differentiation: Both firms located at 'x'.**
- ▶ Bertrand pricing  $p_A = p_B = 0$  and both get zero profit.
- ▶ **Differentiation: Firms located at  $x_A > x_B$ .**

- ▶ Given prices  $p_A > p_B$  demand is

$$q_A = 1 - \frac{p_A - p_B}{x_A - x_B} \quad \text{and} \quad q_B = \frac{p_A - p_B}{x_A - x_B} - \frac{p_B}{x_B}$$

- ▶ Tradeoff: marginal vs. inframarginal agents.
- ▶ Firm with higher quality has higher profits.

# Strategy: Vertical Differentiation II

---

- ▶ **How much differentiation?**
  - ▶ Producing higher quality is costly
  - ▶ Higher quality raises WTP of agents and thus prices.
- ▶ **What if there is only one firm?**
  - ▶ Insight: care about WTP of the *marginal* agent.
  - ▶ Example: Three agents have values  $v_1=10$ ,  $v_2=7$  and  $v_3=2$ .
    - ▶ Suppose innovation costs \$1 and increases  $v_1, v_2$  by \$1.
    - ▶ Suppose innovation costs \$1/2 and increases  $v_1$  by \$1.
- ▶ **Returning to two firms.**
  - ▶ Competition becomes softer when high firm raises quality and low firm lowers quality.
  - ▶ Obtain some differentiation in equilibrium.

# From added value to strategy

---

- ▶ To increase profits firm must increase added value
  - ▶ Drive a bigger wedge between benefits and costs
- ▶ How do we identify what strategic moves will do this?
  - ▶ Break down and analyze the specific activities that make a firm different from its competitors
  - ▶ How do these affect benefits/costs?
  - ▶ How can we change the activity mix to create more benefits or reduce costs?
  - ▶ Given a specific customer niche, what activities should we engage in so as best to serve them?

# Generic Strategies

# Generic strategies

---

- ▶ The analysis of differentiation leads to a taxonomy of generic competitive strategies along two dimensions
- ▶ **Cost vs. Benefit leadership**
  - ▶ i.e. *how* to compete on the vertical dimensions
- ▶ **Broad vs. Focus strategies**
  - ▶ broad = try to serve a wide range of customer segments and/or offer a full line of related products
  - ▶ focus = target a narrow customer segment and/or offer a narrow set of product varieties
  - ▶ i.e. *where* to compete on the horizontal dimensions

# Cost vs. Benefit leadership

---

- ▶ **Cost position more attractive if:**
  - ▶ Unexploited economies of scale in industry
  - ▶ Quality improvements impossible (e.g. commodities), not valued (e.g. phone size), or easily imitated (e.g. search good).
- ▶ **Benefit position more attractive if:**
  - ▶ Economies of scale exploited.
  - ▶ Quality valued by customers (e.g. phone features) and not easily imitated (e.g. experience good)
- ▶ **Can you do both? Porter: Stuck in the middle.**
  - ▶ Delivering superior customer benefits is usually costly
  - ▶ Consistent image helpful for reputation
  - ▶ Different positions require different organizational choices
- ▶ **But higher B may imply larger scale and hence lower C**

# Broad vs. Focus

---

- ▶ **Broad strategy (e.g. Apple)**

- ▶ Attractive if there are economies of *scope* across products
  - ▶ Can use common components in different products (e.g. batteries).
  - ▶ Can share branding/reputation advantages
  - ▶ Complementarities in consumption (e.g. Mac and iPhone)

- ▶ **Focus strategy (e.g. Motorola)**

- ▶ Attractive if consumer heterogeneity is important, economies of scale in narrow product segments or expertise in product not transferable.

# Sustainability

# Sustainability

---

- ▶ **Competitive advantages depend on a firm's**
  - ▶ Resources (things you have): a firm's physical, human, and other intangible assets (knowledge, reputation)
  - ▶ Capabilities (things you can do): organizational routines that transform a firm's resources into goods and services
- ▶ **To be sustainable, a resource must be**
  - ▶ Hard to imitate
  - ▶ Immobile
- ▶ **We'll discuss three special cases:**
  - ▶ Early mover advantages
  - ▶ Networks of activities and sustainability
  - ▶ Core competencies

# Sustainability: Google

---

- ▶ Google has high value added today.
- ▶ Will it have high value added in 5 years? 20 years?
- ▶ List of competitive advantages
  - ▶ Expertise in search
  - ▶ Network of advertisers
  - ▶ Quality of people
  - ▶ Culture of innovation
- ▶ Are these sustainable?

# Barriers to Imitation

---

- ▶ A resource is a source of sustainable advantage if it is difficult / costly for competitors to duplicate.
  1. Competitors cannot access resources
    - ▶ Literal scarcity (diamond mines),
    - ▶ Legal restrictions (patents; trademarks; licenses)
    - ▶ Privileged access to buyers or suppliers (long-term contracts)
  2. Competitors cannot imitate
    - ▶ Causal ambiguity (firm does many things; which are critical?)
    - ▶ Competitor cannot observe parts of strategy (e.g. Google algorithm)
    - ▶ Path dependence (firm succeeded because of historical circumstances that no longer exist)
    - ▶ But hire away key employees?

# Barriers to Imitation

---

3. **Not profitable for competitors to imitate**
  - ▶ Large returns to scale mean imitator cannot cover fixed costs
  - ▶ High switching costs create entry cost for imitator
  - ▶ Imitator needs to build up network
  - ▶ Imitator expects harsh price competition
  
4. **By time competitor imitates, firm in better position**
  - ▶ Learning by doing
  - ▶ Continual technological advancement

# Immobility

---

- ▶ If perfectly mobile, resources extract all the rents
  - ▶ Lionel Messi should collect value of Champions League win.
- ▶ Example: FIFA has exclusive agreement with EA for soccer video games.
  - ▶ Is this a source of sustainable competitive advantage for EA?
- ▶ Immobility depends on
  - ▶ Contractibility (can you sell a reputation?)
  - ▶ Definability (knowledge may be dispersed throughout firm)
  - ▶ Complementarily with other assets (can't just move one asset)

# Three Examples of Sustainable Advantage

# (1) First Mover Advantage

---

- ▶ Many of the barriers to imitation we have discussed suggest an advantage for first movers
  - ▶ Getting a prime location
  - ▶ Securing an exclusive contract
  - ▶ Being the first to pay sunk costs in a natural monopoly
  - ▶ Moving down a learning curve
  - ▶ Capturing consumers in a market with switching costs
  - ▶ Building an installed base for your standard

# First Mover Advantage via Competition

---

- ▶ **Suppose firm A is in industry.**
  - ▶ Has marginal cost 5.
  - ▶ 100 customers with value 10.
  - ▶ A is currently charging  $p=10$  and making  $\pi=100(10-5)=500$ .
- ▶ **Firm B is considering entering**
  - ▶ Has marginal cost 4 and fixed cost 150.
  - ▶ Good is homogenous.
- ▶ **Should firm B enter?**
  - ▶ If it enters, Bertrand competition implies price falls to  $p=5$ .
  - ▶ B's profits are  $\pi=100(5-4)-150 = -50$ .
  - ▶ B should not enter, anticipating the cut-throat competition.

# But... Late Mover Advantage

---

- ▶ First-movers are guinea pigs (e.g. SaeHan's MP3 player)
- ▶ First mover pays costs that benefit the late comers
  - ▶ Consumer awareness of a new technology (e.g. LCD TVs)
  - ▶ Supply chains and distribution channels (e.g. MP3 and flash)
  - ▶ Complementors (e.g. iPhone and apps)
  - ▶ Investments by consumers (e.g. Blu-Ray and player)

## (2) Coherent Strategies

---

- ▶ **Porter (1996).**
  - ▶ Sustainable strategies rest on doing many interlocking activities
  - ▶ Create fit among activities, doing all well
  - ▶ Make trade-offs. Choose what not to do.
  - ▶ Complementarities increase value added.
- ▶ **Systems of activities hard to imitate**
  - ▶ Causal ambiguity
  - ▶ Have to imitate the entire system
  - ▶ Danger: when growing firm forgets what makes them unique.

# Toyota's "Modern Manufacturing" System

---

- ▶ Toyota was small firm; couldn't copy US mass production.
- ▶ Just-in-time manufacturing
  - ▶ Inventories subject to large economies of scale.
  - ▶ Toyota reduced inventories via close coordination.
- ▶ Reliability of process
  - ▶ Without buffer of inventories, engineers worked on reliability.
- ▶ Fewer flaws in product
  - ▶ Problems noticed immediately, rather than sitting in inventories.
- ▶ Suppliers used because not scale to produce in-house
  - ▶ No inventories so develop close relationship
- ▶ Flexible machines due to lack of scale.
  - ▶ Frequent redesigns possible.

## (3) Core competencies

---

- ▶ A small number of key assets or capabilities define a firm's competitive advantage
  - ▶ Google: culture, experience of search
  - ▶ Canon: precision mechanics, fine optics, micro-electronics
- ▶ Seems very different from the Porter formulation
  - ▶ Focus on a few key things instead of a network of activities
- ▶ However, it carries a similar message
  - ▶ Focus on deepening advantages
  - ▶ Look for niches in which current assets give you an advantage
