

The Information Economy

Network Effects

Network Effects

- ▶ **Network**
 - ▶ Set of interconnected nodes
 - ▶ Real network (faxes) and virtual networks (Word users)
- ▶ **Network effect (or network externality)**
 - ▶ A's value depends on number of other users (and identity)
 - ▶ Positive network effects: email, videoconferencing
 - ▶ Negative network effects: congestion
- ▶ **Scale economies**
 - ▶ Network effects = demand-side scale economies
 - ▶ Different from supply-side scale economies (i.e. falling MC)
- ▶ **Consider the following examples:**
 - ▶ Electric cars, Gchat, Gmail.

Direct vs. Indirect

▶ Direct network effects

- ▶ Users care inherently about other users (e.g. Gchat, faxes)

▶ Indirect network effects

- ▶ Users care about complements (e.g. Apps, games, fuel pumps)
- ▶ Think of as one-sided network good if firm passive in market for complements (e.g. electric cars and fueling stations).
- ▶ Think of as platform market if firm controls market for complements (e.g. Xbox prices for games and consoles).

Growth of a Network

Demand Side

Metcalfe's Law

Strength of Network Effects

- ▶ Metcalfe's law: $V(N) = k(N-1)$
 - ▶ Care about total number of nodes in network.
- ▶ Quicker growth at start
 - ▶ On facebook, I care if my friends are linked (becomes standard)
 - ▶ Want all my friends on facebook so I can send out invitations
 - ▶ Fixed cost of entry for complements (e.g. electric cars)
- ▶ Satiation
 - ▶ At Match.com don't care about 1000th person as much as 10th
 - ▶ People joining first may be more valuable to the network
- ▶ How does $V(N)$ vary across networks?
 - ▶ Importance of connection between users (e.g. Word vs. LaTeX)
 - ▶ Density of network (e.g. Friendster in SF, Facebook at Harvard)

Agent's Values

- ▶ An agent's value rises as the network size grows

Demand is a little more complex

- ▶ People care about identity of those in the market
 - ▶ I only care if my friends are on facebook
- ▶ Demand for variety within network
 - ▶ Homebuying (MLS listings) vs. mortgage quotes (lending tree)
 - ▶ Examples: Mobility (credit cards), Novelty (DVDs)
- ▶ Demand for variety across networks
 - ▶ Standardization leads to loss of variety.
 - ▶ Example: People buy different cars despite network effects.

Demand Curves

- ▶ Demand curves corresponding to three network sizes

Fulfilled Expectations Demand Curve

- ▶ Values where expected demand equals realized demand
 - ▶ Intercept negative – positive homing cost, e.g. training, capital.

Perfect Competition (e.g. email, faxes)

- ▶ Marginal cost pricing yields three equilibria: N_0 , N_1 , N_2 .

Role of Expectations

- ▶ **Expectations are crucial**

- ▶ Homing cost and $P > 0$ mean don't want to buy if N low.
- ▶ Care about current base and expected future base.
- ▶ Product will succeed if it is expected to succeed!

- ▶ **Penguin problem**

- ▶ Consumer faces uncertainty about technology and future N .
- ▶ No-one wants to adopt first.

Role of Expectations

- ▶ Equilibrium $N1$ is unstable (called “tipping point”)
 - ▶ If start with $N > N1$, get virtuous cycle: $N \rightarrow N2$.

- ▶ Exercise: What happens if start with $N < N1$?

What to do about Expectations?

- ▶ **Manage expectations directly**
 - ▶ Product announcements (vaporware)
- ▶ **Enable users to internalize externality**
 - ▶ Encourage children to buy grandmother webcam.
- ▶ **Give introductory discounts**
 - ▶ Need network “sponsor” to have market power to overcome free-riding (unless all industry commits)
 - ▶ Risk of adverse selection (e.g. Xbox as DVD player)
- ▶ **Have people sign contracts**
 - ▶ “I’ll adopt if at least N people do”
- ▶ **Start with small networks (e.g. eHarmony)**
 - ▶ Local vs. global network effects

Monopoly Pricing (e.g. Word, eBay)

- ▶ At optimal quantity N^* , $MR=MC$. Yields price P^* .
- ▶ But if charge price P^* , there are three equilibria: N_0 , N_1 , N^*

Monopoly: Unique Implementation

- ▶ By charging $P(N)$ the firm can pick N^* as only equilibrium
 - ▶ Analogous to introductory discounts for early adopters.

Monopoly Pricing: Formal Analysis

- ▶ Let n be market size, n^e be expected market size
 - ▶ Demand curve is $p(n;n^e)$.
 - ▶ Fulfilled expectations demand is $p(n;n)$, where $n=n^e$.
 - ▶ Cost $c(n)$
- ▶ Firm chooses n to maximize $\pi = np(n;n)-c(n)$.
 - ▶ Ignoring problem of multiple equilibria.
- ▶ The first order condition is

$$p(n;n) + n \frac{\partial p(n;n)}{\partial n} + n \frac{\partial p(n;n)}{\partial n^e} = \frac{\partial c(n)}{\partial n}$$

- ▶ First and second terms – standard marginal revenue.
- ▶ Third term – network effect, i.e. how increasing ‘ n ’ increases value of marginal user. Like an increase in marginal revenue.

How to Launch: Facebook

- ▶ **Started at Harvard in February 2004**
 - ▶ Built on existing social networks (75% of Harvard within month)
 - ▶ Easy to find friends (using course register)
 - ▶ Can invite friends (internalizing externalities)
 - ▶ Used influential people (Phoenix club)
- ▶ **Expansion**
 - ▶ Expanded through Universities (use existing social structure)
 - ▶ Surrounded holdout University to conquer (network effect)
- ▶ **Ultimately successful because**
 - ▶ Innovative (news feed, photos, Inbox, applications)
 - ▶ Privacy controls (people share more information)
 - ▶ Reliable

Two Technologies

- ▶ We have so far considered one technology
 - ▶ Two stable equilibria: N0 and N2
- ▶ If two technologies, A and B, there are three equilibria
 - ▶ A becomes dominant
 - ▶ B becomes dominant
 - ▶ Neither become dominant
- ▶ Multiple technologies might make “neither” more likely
 - ▶ Customers don’t know who will win, and so wait.
 - ▶ Examples: AM stereo radio, Satellite radio, Cell phone standards

Strategy

Collective Switching Costs

- ▶ Network effects act like collective switching costs
 - ▶ Small switching costs are magnified.
- ▶ Entrant comes into industry (e.g. Gchat)
 - ▶ Need people to switch in coordinated way.
 - ▶ Problem where there are positive homing costs.
- ▶ Example: QWERTY vs. Dvorak
 - ▶ Dvorak is better layout – typing is quicker.
 - ▶ Costly to train on new system.
 - ▶ Typing interface has network effects.
- ▶ Sometimes new format work; sometimes not
 - ▶ Examples: CDs, DAT, DCC, Minidisc.

Compatibility Choices

- ▶ **Backwards compatible** – new technology reads old input
 - ▶ Word 07 reads .doc files
 - ▶ PS3 plays PS2 games
- ▶ **Forwards compatible** – old technology reads new input
 - ▶ Word 2003 converter for .docx files
 - ▶ But cannot save .docx files.
- ▶ **Tradeoffs**
 - ▶ Compatibility may cause loss of performance
 - ▶ Compatibility increases network effects
 - ▶ Lack of compatibility can force people to upgrade because of network effects

Closed Systems: Standards Wars

- ▶ **Winner takes all competition? (Electricity, vs. Gchat)**
 - ▶ Is multi-homing possible?
 - ▶ Strength of network effects
 - ▶ Demand for variety across networks.
- ▶ **Firms fight over the large prize**
 - ▶ Willing to sustain losses in the short-term
 - ▶ War of attrition.

War of Attrition

- ▶ **Two firms: A and B**
 - ▶ Make $\pi - c$ per period if monopolist.
 - ▶ Make $-c$ per period if duopolist (Bertrand competition).
 - ▶ Each period choose whether to stay or quit industry.
- ▶ **Asymmetric equilibrium**
 - ▶ A always stays and makes $(\pi - c)/(1 - \delta)$; B immediately quits.
- ▶ **Symmetric equilibrium (rent dissipation)**
 - ▶ Both quit with probability p per period.
 - ▶ Both indifferent between staying and quitting:
$$p \left(\frac{\pi - c}{1 - \delta} \right) + (1 - p)(-c) = 0 \quad \Rightarrow \quad p = \frac{(1 - \delta)c}{\pi - \delta c}$$
 - ▶ Hence p rises as π falls, c rises or δ falls.

How to Avoid a War of Attrition?

▶ Pre-emption

- ▶ First-mover advantage
- ▶ Penetration pricing
- ▶ Win over influential customers (early adopters)

▶ Expectations management

- ▶ Vaporware – MS operating system, Apple devices
- ▶ Make claims about network size, e.g. “world’s largest”

▶ Vibrant market for complements

- ▶ Develop own complements (e.g. VHS vs. Betamax)
- ▶ Buy exclusive right to complements (e.g. MS and Halo)

Example: Penetration Pricing

- ▶ Suppose N_1 early adopters and N_2 late adopters
 - ▶ All consumers have value $v(N)$ from network size N
 - ▶ Ignore coordination problem among users
- ▶ Stage 2: Firm W has N_1 customers, L has none.
 - ▶ Equilibrium prices: $p_W = v(N_1 + N_2) - v(N_2)$ and $p_L = 0$.
 - ▶ Profits: $\pi_W = N_2 [v(N_1 + N_2) - v(N_2)]$, $\pi_L = 0$.
- ▶ Stage 1: Neither customer has any customers.
 - ▶ Both firms lower prices until winner's profit=0
 - ▶ That is, $\pi = p_1 N_1 + \pi_W = 0$. This yields:

$$p_1 = -\frac{N_1}{N_2} [v(N_1 + N_2) - v(N_2)]$$

Open vs. Closed

- ▶ **Closed – system proprietary**
 - ▶ Examples: iPhone, Betamax, IM, Mac, Windows
 - ▶ Competing for market
- ▶ **Open – interface/specifications open to others**
 - ▶ Examples: Android, VHS, email, PC, UNIX
 - ▶ Can be set by private firm (e.g. IBM and VGA) or by standard setting committee (e.g. ITU and telecoms)
 - ▶ Competing within market
- ▶ **Compatibility decision may be one-sided or two-sided**
 - ▶ Two-sided: Need permission of both parties.
 - ▶ One-sided: One sided can use adapter (e.g. WP open .doc files)
- ▶ **Partial compatibility**
 - ▶ MS and Netscape cooperated on secure transactions.

Why use Open?

- ▶ Is Open system crazy?
 - ▶ Potential for cut-throat competition after takes off (e.g. IBM)
 - ▶ Give IP away – make entry easier; lose competitive advantage.
- ▶ Advantages of Open
 - ▶ Increase network size and probability of takeoff (e.g. IBM)
 - ▶ Avoid market confusion (AM Stereo, Cell phone standards)
 - ▶ Customers avoid lock-in, which again helps takeoff
 - ▶ Harness creativity of other firms
- ▶ Making money from Open
 - ▶ Sell complements such as service (e.g. MySQL and Sun)
 - ▶ Sell enhancements (e.g. pdf and Adobe)
- ▶ Prefer open if weak (e.g. Netscape, T-Mobile)

Standard Setting

- ▶ **Standards set by committees:**
 - ▶ Examples: Safety standards (UL) or Telecoms (ITU)
 - ▶ Government (NIST) or Industry (IEEE)
- ▶ **Establishing a standard**
 - ▶ Pools patents and overcomes coordination problems
 - ▶ Forces firms in pool to charge “fair” prices
 - ▶ Commitment to be open
- ▶ **But**
 - ▶ Process lengthy
 - ▶ Process may fail (e.g. DVD “read” agreed before DVD “write”)
 - ▶ Incentive to stay out of patent pool
 - ▶ Give up right to charge license fees
- ▶ **Exercise: Name a product where a standard would be useful.**

Example: The DVD War

▶ MMCD - Sony & Phillips

- ▶ One sided
- ▶ Dual layer
- ▶ 3.7GB
- ▶ 135 min video
- ▶ Easy manufacture
- ▶ Less expensive

▶ SDD - Toshiba, Matsushita

- ▶ Two sided
- ▶ Single layer
- ▶ 5 GB
- ▶ 270 min video
- ▶ 6 channel sound

▶ Outcome

- ▶ Technical Working Group of Apple, Microsoft, Sun, Dell,...
- ▶ TWG boycotted both standards until both camps agreed
- ▶ Result most similar to SDD, but dual layered
- ▶ 4000 patents in total, 20% Matsushita, 20% Pioneer, 20% Sony,...
